

Shubh swasan, part of swasan group, is a pioneer in the field of specialty coatings and laminations on textiles.

Managed by a team of young and dynamic entrepreneurs, Shubh swasan is the only Indian company having all facilities for textile innovations under one roof viz. coating, finishing, bonding, lamination, nonwovens, fusible interlinings and water proof breathables.

Equipped with hi-tech manufacturing facilities and innovative coating technology viz. **trp** coating technology for interlinings and **pure trp** for water proof breathable fabrics, Shubh swasan produces a wide range of technical textiles that cater to shoes, garments, medical, home furnishing, military, etc.

The in-house fully equipped lab ensures quality control and check for on-line production.

Product development and research is a continuous process at Shubh Swasan. With its R&D and a team of experienced and technical experts, Shubh Swasan has the greatest advantage of producing textiles to suit specific technical requirements and end applications.

MADE IN INDIA

how safe is your pillow?

MEDISAFE

protective pillow cover

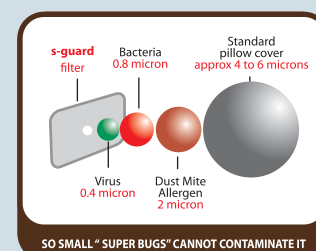

with advanced
s-guard filter technology

features & benefits

-  **impermeable**
- does not allow blood, liquids, fluids, etc. to pass through
-  **dust-mite barrier**
- barrier to dust-mites, germs and other infections
-  **breathable**
- allows body vapour to pass
-  **washable**
- machine washable at 40°C
-  **hygienic, soft and comfortable**

the s-guard filter technology

MEDISAFE has been created using the advanced **s-guard filter** technology that makes the pillow cover blood proof, waterproof and breathable. This special fabric is manufactured using GERMAN TECHNOLOGY which acts as a barrier to germs, bacteria, infection breeding inside the pillow. It has great resistance to washing and gives the elasticity that allows perfect adaption of body movements.

s-guard filter technology works exactly like the human skin - does not allow liquids to pass through but still breathes!!!

fit MEDISAFE with ease

YOUR DOCTOR CAN TREAT YOU

HIS MEDICATIONS WILL CURE YOU.

But what about the infections that you have caught on from the pillow?

Ever realised what is working inside your pillow?

You will be surprised that blood, vomit, fluids, sweat, etc. from some other patient has entered the pillow and now, all the infection is breeding inside.

A recent study by Dr Arthur Tucker, Principal Clinical Scientist and Senior Lecturer at St. Barts and the London Hospitals shows that the pillow is biggest source for transfer of infection / disease from one patient to another.

The study by The Barts and The London NHS Trust found 30 different types of infection in a sample of pillows taken from hospital wards, posing a significant risk of infection.

The tests revealed high levels of 'living' contamination on the outside of the pillows. In some cases, rips and tears meant that the germs had found their way into the filling. Some pillows were contaminated with the E.coli stomach bug. Others contained germs that can cause respiratory and urinary tract infections.

Many hospital-issue pillows had more than one million Staphylococcus hominus per millilitre – the bug can cause severe infections in people with weakened immune systems. Dr Tucker described the level as a 'bio-hazard'. He said: 'The presence of these bugs means that they can and will be passed to patients.'

Nurses are required to regularly wash their hands and disinfect bed frames and mattresses, but underestimate the risk of infection from dirty pillows, a report said.

Dr Tucker warned that simply popping on a clean pillow case is not enough. 'People put a clean pillow case on and it looks and smells nice and fresh but you are wrapping up something really nasty underneath,' he said.
